

- When a class extends another, it inherits the parent class's static properties and methods

```
class Parent {  
  static greetParent() {  
    return 'Hello, I am the parent!';  
  }  
}  
  
class Child extends Parent {  
  static greetChild() {  
    return 'Hello, I am the child!';  
  }  
}  
  
console.log(Parent.greetParent());  
console.log(Child.greetParent());  
console.log(Child.greetChild());
```
