Class constructor is a magic method

- Constructor execute automatically when object is created
- Constructor can take parameter
- Constructor method can't return any result

```javascript
class Person {
    constructor() {
        console.log('I am a constructor')
    }
}
const person1 = new Person();
```

- Constructor Parameter

```javascript
class Person {
    constructor(msg) {
        console.log(msg)
    }
}
const person1 = new Person('I am a constructor');
```

- Change class properties value using constructor

```javascript
var Person=class  {

    //Properties
    first_name='Jhon'
    last_name='Dee'

    constructor(name1,name2) {
        this.first_name=name1
        this.last_name=name2
    }

    //method
    getName() {
        return (`The name of the person is ${this.first_name} ${this.last_name}`)
    }
}

const person1 = new Person("Robin","Hood");
console.log(person1.getName());
```
